

# KMXP MR Position Sensor

- AMR linear position sensor
- 2x6 DFN package, very compact
- Small wall thickness for large air gaps
- High operating temperature of 150°C
- On the edge soldering possible
- ✓RoHS

## DESCRIPTION

Moving a KMXP sensor along a magnetic scale will produce a sine and a cosine output signal as a function of its position. In order to deliver satisfying results, this will be achieved as long as the air gap between sensor edge and magnetic scale surface does not exceed approximately half of the pole pitch. As the sensor principle is based on the anisotropic magneto resistance effect, the signal amplitudes are nearly independent on the magnetic field strength and therefore air gap variations do not have a strong effect on the accuracy. The sensor detects a magnetic gradient field and is thus almost insensitive to homogenous stray fields.

Precise displacement values will be obtained by using an amplifier in combination with a microcontroller or commercial sine/cosine interpolator device. The maximal obtainable precision depends strongly on the accuracy of the magnetic scale and on the distance sensor – magnetic scale. Precision values of <1% of the pole pitch are common.

## FEATURES

- Contactless angular position measurement
- High accuracy
- Low cost, low power
- Failure detection possible
- User has total control over signal evaluation
- Extended temperature range
- REACH, 3TG & ROHS compliant

## APPLICATIONS

- Measurement of linear displacements, movements, velocities in dirty environments
- Very precise angular measurement on the circumference using pole wheels
- Torque measurement in harsh environment

## TYPICAL PERFORMANCE CURVES

Figure 2: typical output signal voltage depending on sensor position

## FUNCTION

Figure 3: principle function of the sensor

The KMXP sensors consists of two magneto resistive Wheatstone bridges, whose resistors are placed in a way that the characteristic magnetic field distribution of a magnetic scale with matching pole pitch produces a sine and a cosine signal output, when the sensor is moved along the scale. In addition, some sensor types integrate over more than one pole in order to improve sensor performance.

## EXAMPLE FOR A PRINTED CIRCUIT BOARD ASSEMBLY

## PIN ASSIGNMENT

The pin assignment is pin compatible for all KMXP types and allows a common PCB layout for all types:

Pin	1	2	3	4	5	6	7	8	9	10	11	12
<b>KMXP5000</b>	Vcc2	-V2	-V1	GND	Vcc1	+V1	+V2	N/C	N/C	N/C	N/C	N/C
<b>KMXP2000</b>	N/C	-V2	-V1	GND	Vcc	+V1	+V2	N/C	N/C	N/C	N/C	N/C
<b>KMXP1000</b>	N/C	-V2	-V1	GND	Vcc	+V1	+V2	N/C	N/C	N/C	N/C	N/C
